

## WAKIX Offers Convenient Once-Daily Morning Dosing

- WAKIX is available in two tablet strengths for titration and flexible dosing: 4.45 mg and 17.8 mg

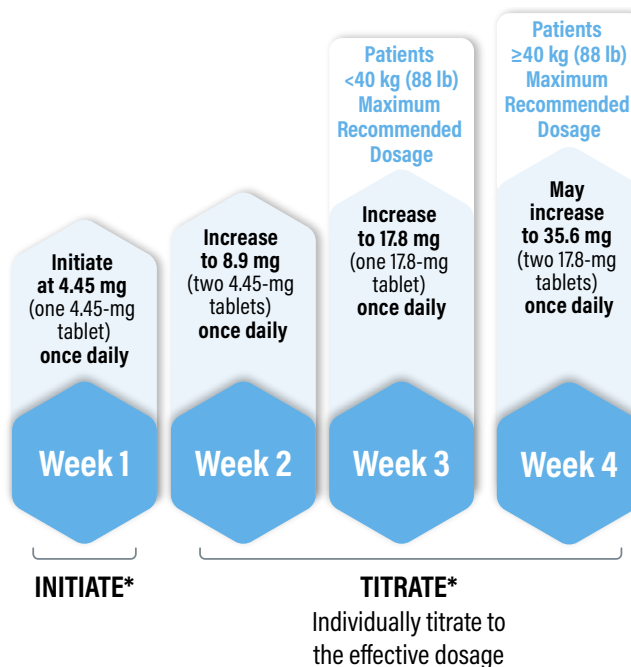

### Adult Patients

The recommended dosage range for WAKIX for the treatment of EDS or cataplexy in adult patients is 17.8 mg to 35.6 mg taken once daily in the morning upon waking

### Pediatric Patients

The recommended starting dosage for WAKIX for the treatment of EDS in pediatric patients 6 years and older is 4.45 mg taken once daily in the morning upon waking

\*Recommended titration schedule. Not all patients respond equally to WAKIX.

- Dose may be adjusted based on tolerability
- It may take up to 8 weeks for some patients to achieve a clinical response

- After initiating treatment with WAKIX, it is important to regularly assess patients for symptom improvement and tolerability
- If a dose is missed, patients should take the next dose the following day in the morning upon waking

### Dosage modifications

- Dosage modifications are recommended for patients with moderate hepatic impairment, patients with moderate or severe renal impairment, patients receiving concomitant strong CYP2D6 inhibitors or strong CYP3A4 inducers, and patients known to be poor CYP2D6 metabolizers; see Full Prescribing Information for recommended dosage and titration

EDS, excessive daytime sleepiness.

### Indications and Usage

- WAKIX is indicated for the treatment of excessive daytime sleepiness (EDS) or cataplexy in adult patients with narcolepsy and for the treatment of excessive daytime sleepiness (EDS) in pediatric patients 6 years of age and older with narcolepsy.

### Important Safety Information

#### Contraindications

- WAKIX is contraindicated in patients with known hypersensitivity to pitolisant or any component of the formulation. Anaphylaxis has been reported. WAKIX is also contraindicated in patients with severe hepatic impairment.

#### Warnings and Precautions

- WAKIX prolongs the QT interval. Avoid use of WAKIX in patients with known QT prolongation or in combination with other drugs known to prolong the QT interval. Avoid use in patients with a history of cardiac arrhythmias, as well as other circumstances that may increase the risk of the occurrence of torsade de pointes or sudden death, including symptomatic bradycardia, hypokalemia or hypomagnesemia, and the presence of congenital prolongation of the QT interval.
- The risk of QT prolongation may be greater in patients with hepatic or renal impairment due to higher concentrations of pitolisant; monitor these patients for increased QTc. Dosage modification is recommended in patients with moderate hepatic impairment and moderate or severe renal impairment. WAKIX is contraindicated in patients with severe hepatic impairment and not recommended in patients with end-stage renal disease (ESRD).

## Dosing WAKIX With Other Medications

Access an interactive tool to identify drug interactions and recommendations for dosing WAKIX with other medications at [WAKIXhcp.com](https://www.wakixhcp.com)

### Find Resources to Help With Prescribing

WAKIX RxCenter has resources and information to guide you and your practice through each step of the prescribing process. Visit [WAKIXRxCenter.com](https://www.wakixrxcenter.com) to:

- Download the WAKIX Prescription Referral Form
- Check formulary coverage
- Access prior authorization resources
- Contact the Specialty Pharmacy
- Connect with a Field Reimbursement Manager

## Important Safety Information

### Adverse Reactions

- In the placebo-controlled clinical trials conducted in adult patients with narcolepsy with or without cataplexy, the most common adverse reactions ( $\geq 5\%$  and at least twice placebo) for WAKIX were insomnia (6%), nausea (6%), and anxiety (5%). Other adverse reactions that occurred at  $\geq 2\%$  and more frequently than in patients treated with placebo included headache, upper respiratory tract infection, musculoskeletal pain, heart rate increased, hallucinations, irritability, abdominal pain, sleep disturbance, decreased appetite, cataplexy, dry mouth, and rash.
- In the placebo-controlled phase of the clinical trial conducted in pediatric patients 6 years and older with narcolepsy with or without cataplexy, the most common adverse reactions ( $\geq 5\%$  and greater than placebo) for WAKIX were headache (19%) and insomnia (7%). The overall adverse reaction profile of WAKIX in the pediatric clinical trial was similar to that seen in the adult clinical trial program.

### Drug Interactions

- Concomitant administration of WAKIX with strong CYP2D6 inhibitors increases pitolisant exposure by 2.2-fold. Reduce the dose of WAKIX by half.
- Concomitant use of WAKIX with strong CYP3A4 inducers decreases exposure of pitolisant by 50%. Dosage adjustments may be required.
- $H_1$  receptor antagonists that cross the blood-brain barrier may reduce the effectiveness of WAKIX. Patients should avoid centrally acting  $H_1$  receptor antagonists.
- WAKIX is a borderline/weak inducer of CYP3A4. WAKIX may reduce the effectiveness of sensitive CYP3A4 substrates, including hormonal contraceptives. Patients using hormonal contraception should be advised to use an alternative non-hormonal contraceptive method during treatment with WAKIX and for at least 21 days after discontinuing treatment.

### Use in Specific Populations

- There is a pregnancy exposure registry that monitors pregnancy outcomes in women who are exposed to WAKIX during pregnancy. Patients should be encouraged to enroll in the WAKIX pregnancy registry if they become pregnant. To enroll or obtain information from the registry, patients can call 1-800-833-7460.
- The safety and effectiveness of WAKIX have not been established for the treatment of excessive daytime sleepiness in pediatric patients less than 6 years of age with narcolepsy. The safety and effectiveness of WAKIX have not been established for the treatment of cataplexy in pediatric patients with narcolepsy.
- WAKIX is extensively metabolized by the liver. WAKIX is contraindicated in patients with severe hepatic impairment. Dosage adjustment is recommended in patients with moderate hepatic impairment.
- WAKIX is not recommended in patients with end-stage renal disease. Dosage adjustment of WAKIX is recommended in patients with eGFR  $< 60$  mL/minute/1.73 m<sup>2</sup>.
- Dosage reduction is recommended in patients known to be poor CYP2D6 metabolizers; these patients have higher concentrations of WAKIX than normal CYP2D6 metabolizers.

To report suspected adverse reactions, contact Harmony Biosciences at 1-800-833-7460 or FDA at 1-800-FDA-1088 or [www.fda.gov/medwatch](https://www.fda.gov/medwatch).
